Programming Languages: Summary of the Guarded Command Language

Weakest Precondition

The weakest precondition transformer wp satisfies the following rules:

- $wp \ S \ False = False$.
- $wp \ S \ Q \land wp \ S \ R = wp \ S \ (Q \land R).$
- $wp \ S \ Q \lor wp \ S \ R \Rightarrow wp \ S \ (Q \lor R).$

Denote if $B_0 \to S_0 \mid B_1 \to S_1$ fi by *IF*, do $B_0 \to S_0 \mid B_1 \to S_1$ od by *DO*, and $B_0 \vee B_1$ by *BB*.

$$\begin{array}{ll} wp \ abort & P = False \\ wp \ skip & P = P \\ wp \ (x := E) \ P = P[x \setminus E] \\ wp \ (S; T) & P = wp \ S \ (wp \ T \ P) \\ wp \ IF \ P \\ &= (B_0 \Rightarrow wp \ S_0 \ P) \land (B_1 \Rightarrow wp \ S_1 \ P) \land BB \\ &= ((B_0 \land wp \ S_0 \ P) \lor (B_1 \land wp \ S_1 \ P)) \\ wp \ DO \ P = \\ & \mu \ (\lambda X \rightarrow wp \ IF \ X \lor (\neg BB \land P)) \ , \end{array}$$

where μ *F* denotes the strongest *X* such that *X* = *F X*. The x := E case shall have a side condition that *E* is defined.

General case: denote by $B_i \to S_i$ the guarded commands $B_0 \to S_0 \mid ...B_{n-1} \to S_{n-1}$.

$$wp (if B_i \to S_i fi) P = \langle \forall i : 0 \leq i < n : B_i \Rightarrow wp S_i P \rangle \land \langle \exists i : 0 \leq i < n : B_i \rangle .$$

When n = 0, we have if $\mathbf{fi} = abort$. Similarly,

$$wp (\mathbf{do} \ B_i \to S_i \ \mathbf{od}) \ P = \mu \ (\lambda X \to wp \ (\mathbf{if} \ B_i \to S_i \ \mathbf{fi}) \ X \lor (\neg \ \langle \exists i : 0 \leqslant i < n : B_i \rangle \land P)) \ .$$

When n = 0, we have do od = skip.

Hoare Logic

Definition: $\{P\} S \{Q\} \equiv P \Rightarrow wp S Q.$

The definition entails that

$$\begin{array}{l} \{P\} skip \{Q\} & \equiv P \Rightarrow Q \\ \{P\} x := E \{Q\} \equiv P \Rightarrow Q[x \setminus E] \\ \{P\} S; T \{Q\} & \equiv \\ \langle \exists R :: \{P\} S \{R\} \land \{R\} T \{Q\} \rangle \\ \{P\} IF \{Q\} & \equiv \\ (P \Rightarrow B_0 \lor B_1) \land \\ \{P \land B_0\} S_0 \{Q\} \land \{P \land B_1\} S_1 \{Q\} \end{array}$$

There is also a side condition that *E* is defined. Regarding loops, by the *Fundamental Invariance The*orem, the weakest precondition of *DO* entails that $\{P\} DO \{Q\}$ follows from

- 1. $P \wedge \neg B_0 \wedge \neg B_1 \Rightarrow Q$,
- 2. $\{P \land B_0\} S_0 \{P\}$ and $\{P \land B_1\} S_1 \{P\}$, and
- 3. there exists an integer function *t* on the state space such that
 - (a) $[P \land (B_0 \lor B_1) \Rightarrow t \ge 0],$
 - (b) $\{P \land B_0 \land t = C\} S_0 \{t < C\}$, and
 - (c) $\{P \land B_1 \land t = C\} S_1 \{t < C\}.$

Properties Hoare triples satisfy the following rules:

- $\{P\} S \{ false \} \equiv \neg P,$
- $\{P\} S \{Q\} \land (P_0 \Rightarrow P) \Rightarrow \{P_0\} S \{Q\},$
- $\{P\} S \{Q\} \land (Q \Rightarrow Q_0) \Rightarrow \{P\} S \{Q_0\},$
- $\{P\} S \{Q\} \land \{P\} S \{R\} \Rightarrow \{P\} S \{Q \land R\},$
- $\{P\} S \{Q\} \land \{R\} S \{Q\} \Rightarrow \{P \lor R\} S \{Q\}.$
